

# AIRCAST SKIN CHANGES

Aircast can be changed in its design in nearly each area of the screen.

All commands and options are listed here:

[https://wiki.mairlist.com/reference:skin.ini\\_reference](https://wiki.mairlist.com/reference:skin.ini_reference)

First of all, a file called "skin.ini" is needed. In Aircast 6.0 it must be created manually.

A "how to" is written in the mAirList support forum; unfortunately only in German:

<https://community.mairlist.com/t/anleitung-so-wird-die-skin-ini-unter-windows-eingerichtet/12563>

We have some examples of designs and skin.ini-codes in our mAirList forum.

Keep in mind that it's not so simple only to copy & paste since each Aircast is different.

Additionally, we don't know what the handicapped user prefers (colors, fonts, sizes).

Please note that some elements cannot be changed or the font color is fixed due to Windows design restrictions.

Some examples of individual design are listed in this section of our support forum:

<https://community.mairlist.com/t/what-does-your-mairlist-look-like/10779>

A personal design, looking for a kind of "dark skin", can be seen here below.

As you can see, there are still some elements in white I cannot change, but it can give you an idea of an individually designed Aircast.
